Background

- Key characteristics of carcinogens
- NTP cancer hazard evaluations

Methods for evaluating mechanistic data

Three case studies

- Antimony trioxide
- Haloacetic acids (HAAs)
- Night shift work (NSW)

Conclusions and future directions

10 Key Characteristics of Carcinogens (KCCs)

Review of IARC group 1 carcinogens

1. Electrophilic

2. Genotoxic

3. DNA repair or genomic instability

4. Epigenetic alterations

5. Oxidative stress

Smith et al. 2016. EHP 124(6):713-721

10 Key Characteristics of Carcinogens (KCCs)

6. Chronic Inflammation

7. Immuno-modulation*

8. Receptor-mediated

9. Cell immortalization

10. Alters cell proliferation, cell death, or nutrient supply

*Immunosuppressive in Smith et al. 2016

NTP Cancer Hazard Evaluations

Rigorous methods & structured approach

- Handbook
 - Systematic review methods
 - Specific evaluation criteria
 - Transparent approach for evidence integration
- Scientific input, public comments, public peer review

Types of evaluations

- Report on Carcinogens (RoC)
 - Congressionally mandated
 - 248 listings in 14th edition
- Other cancer hazard evaluations
 - Night Shift Work (NSW) and Light at Night (LAN)

Search terms developed for each KCC

Literature Tagging: Evidence Mapping

NSW/LAN
mechanistic
studies

Used as a synergist in flame retardants

Strength of evidence for KCCs

- Identify data gaps
- Biological plausibility
- Relevance of animal cancer data
- Inform mechanistic pathways

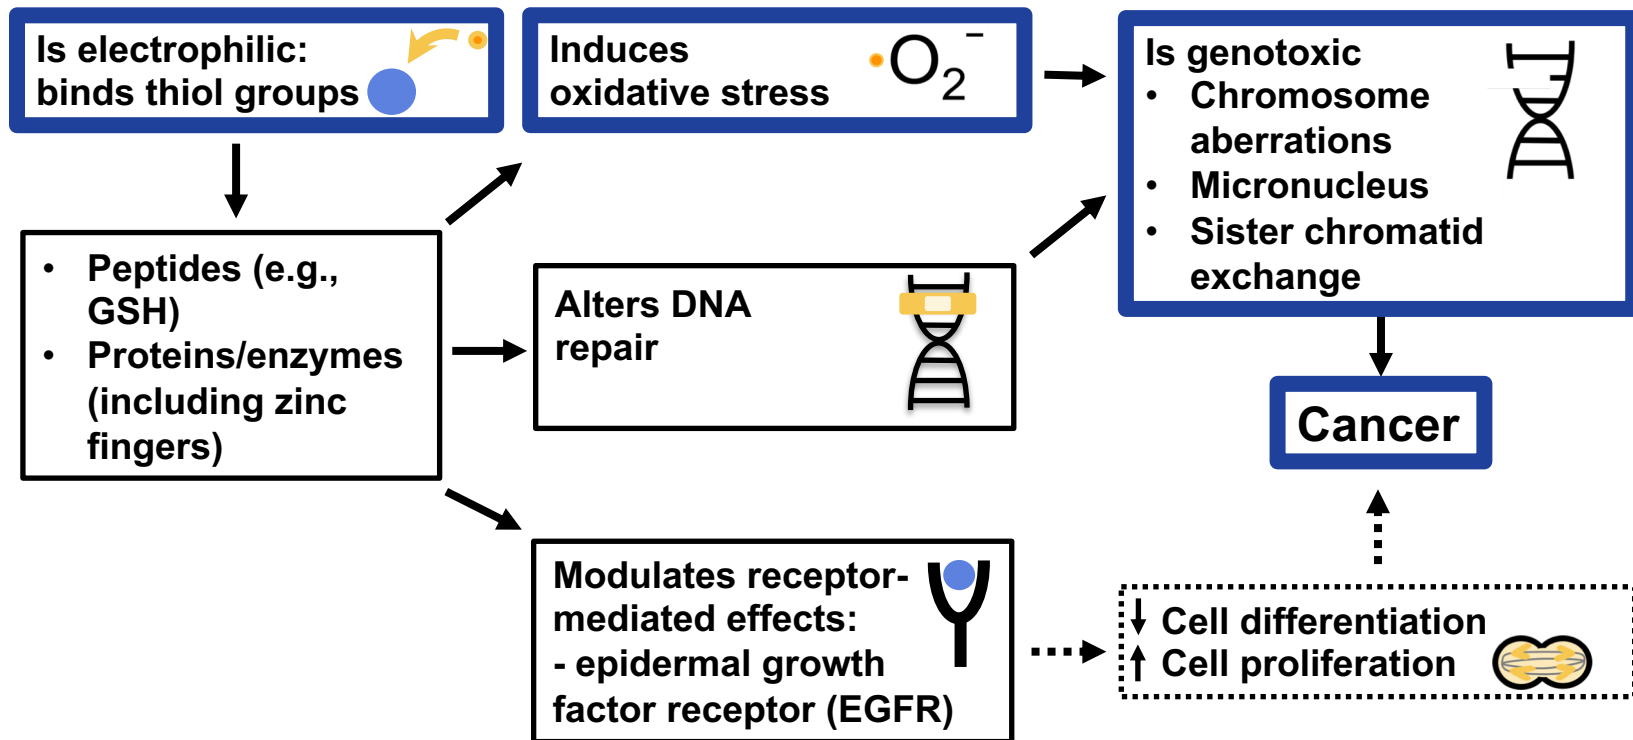

https://ntp.niehs.nih.gov/ntp/roc/monographs/antimony_final20181019_508.pdf

KCCs Informed Possible Mechanistic Pathways

Strong evidence from Sb_2O_3

Strong evidence from Sb^{III} compounds

Group of 13 HAAs found as water disinfection by-products

Strength of evidence for KCCs

-  Strong evidence
-  Moderate evidence
-  Limited evidence

KCCs Informed Read-Across for HAAs

Six tested for carcinogenicity but KCC data available for all 13

Endpoint	Mono-HAAs	Di-HAAs		Tri-HAAs	
Rodent bioassay	<u>CA</u> (–) BA IA	DCA (+) DBA (+) DIA	BCA (+) CIA BIA	TCA (+) TBA	BDCA (+) CDBA
<u>KCCs</u>					
• Genotoxicity	↑ Potency with halogen size (Cl << Br < I)				
• Oxidative stress	↓ Potency with the number of halogens (Mono > Di > Tri)				
• Electrophilicity					

A = acetic acid, B = bromo, C = chloro, I = iodo, D = di, T = tri

Red = tested for rodent carcinogenicity (+ = rodent carcinogen, – = not carcinogenic)

Black = untested for rodent carcinogenicity

Brominated Di- and Tri-HAAs Selected for Read-Across

- Untested (target) HAAs (CDBA, TBA) are metabolized to source HAAs
- Bromines increase the rate of metabolism of tri-HAAs to di-HAAs

- Similar effects
- Clear potency trends

All tested (source) brominated HAAs (DBA, BCA, BDCA) are rodent carcinogens

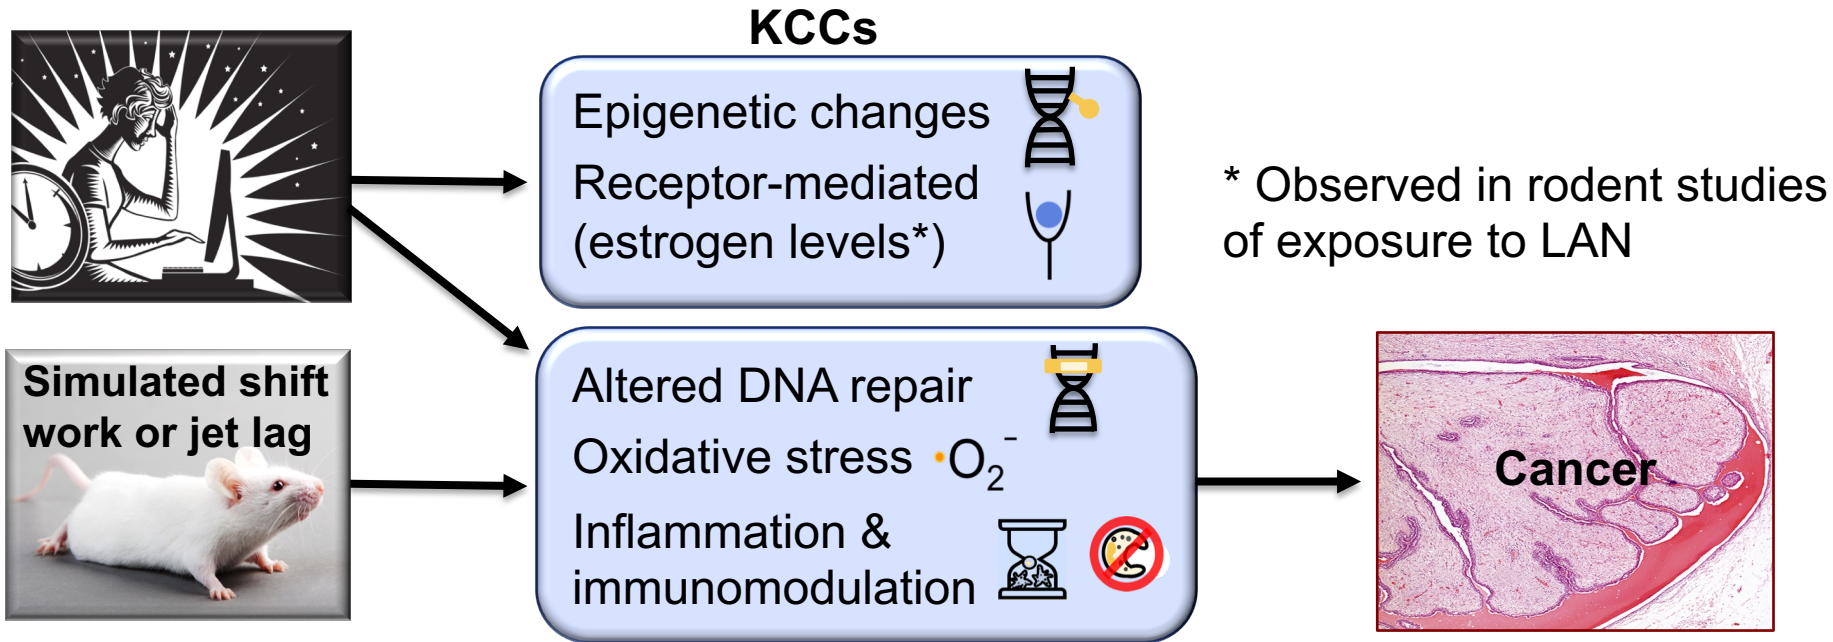

CDBA and TBA are predicted to be rodent carcinogens

Case Study 3: Night Shift Work (NSW)

Similar KCCs observed in night shift workers as seen in rodents

KCCs also observed in studies of tumor promotion in rodents

<https://ntp.niehs.nih.gov/go/717273>

Circadian Disruption is Associated with KCCs and Cancer

Circadian disruption

Altered clock gene expression

KCCs/other relevant effects

- Tumor suppressor genes
- DNA damage checkpoints/repair
- Cell cycle control/cell death
- Cell proliferation/oncogenes
- Cell energy metabolism

Melatonin suppression

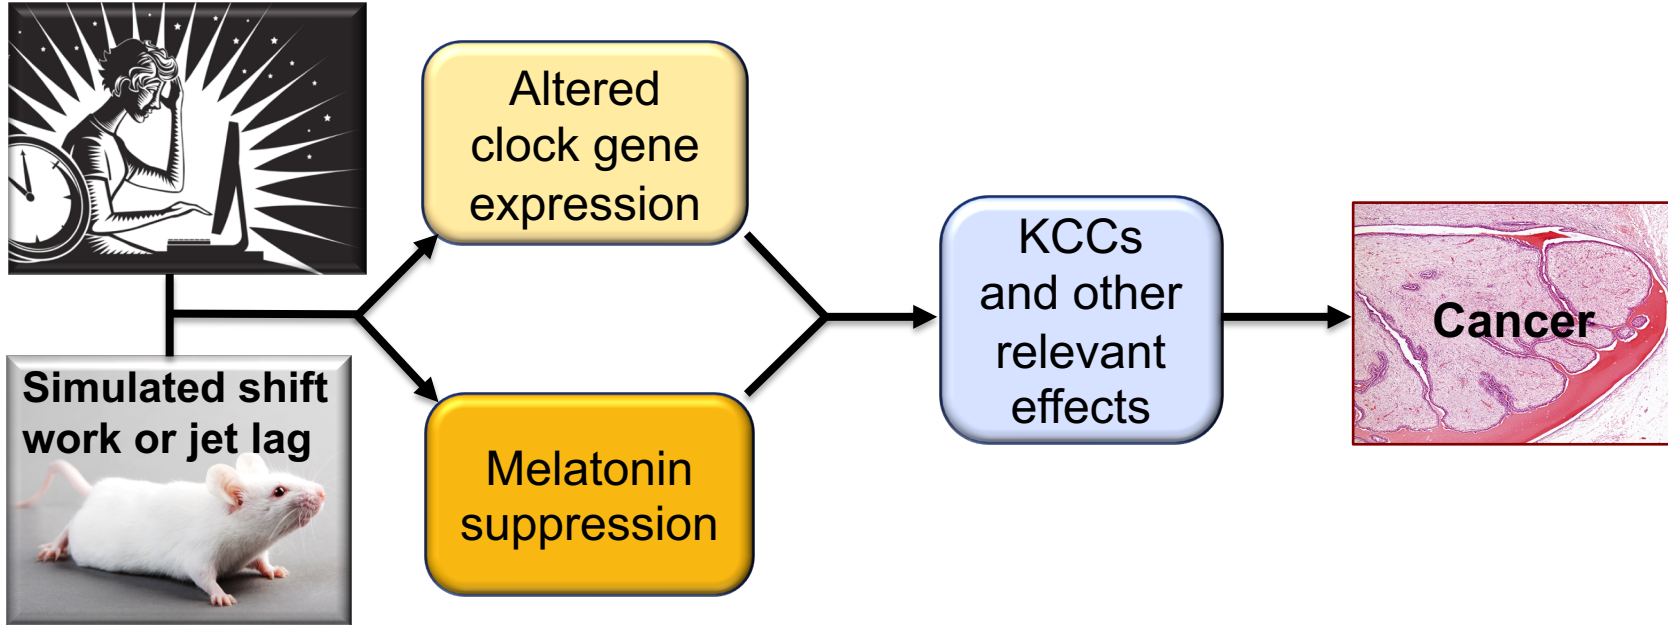

- Oxidative stress response
- Estrogen signaling and biosynthesis
- Cell cycle control/cell death
- Cell proliferation/differentiation
- Cell energy metabolism
- Immunomodulation
- Inflammation
- Metastasis

- Clock gene mutant mice are cancer prone
- Melatonin inhibits tumor growth including LAN-induced tumors

Night Shift Work, Circadian Disruption, KCCs, and Cancer

- NSW is associated with circadian disruption and cancer
- Both NSW and circadian disruption are associated with KCCs
- Circadian disruption likely plays a major role in NSW carcinogenicity

Conclusions and Next Steps

KCCs provide an unbiased approach for mechanistic data assessment

- Framework for searching and organizing the generally large and diverse mechanistic database
- Identify potential mechanistic pathways
- Inform biological plausibility and human relevance
- Identify data gaps and inform read-across approaches

Next steps

- Expand and improve framework for mechanistic evaluations
 - Standardize study quality questions
 - Develop guidelines for level of evidence determinations
 - Information will be captured in next version of RoC handbook
